

# Double-Wall Generator Base Tanks

## Secondary Containment

Double-Wall, Secondary Containment Generator Base Tanks are UL-142 listed and labeled. Both the inner and outer tanks are completely enclosed and pressure tested. The inner (primary) tank is vented with primary and emergency vents, and the secondary containment tank has an individual emergency vent. There are no external cross beams, thereby allowing generator mounting anywhere on the tank top. Tank sits on steel channel supports allowing visual inspection of tank bottom as well as air movement preventing condensation induced corrosion. Tank is designed with rounded corners and no sharp edges allowing proper adherence of a coating system that provides an extended life cycle. Options include through-tank electrical stub-up, and a variety of fill configurations and level alarms.

Supports gensets and enclosures and available in sizes from 300 to 13,500 gallons.
